- Similar to cavity design, start with sketches on the parting surface.
- Use Offset Surface tools to create the core surface, ensuring proper draft angles for ejection.
- Incorporate undercuts and complex features using Multi-Section Surfaces or Spline tools.
- Ensure the core geometry complements the cavity, maintaining proper clearance (typically 0.1 to 0.3 mm).

- Assembling Core and Cavity

- Position the core and cavity bodies together in the assembly.
- Use Assembly Constraints to simulate the closing motion.
- Check for interferences, overlaps, or gaps.

- Refining the Design

- Apply Fillets and Chamfers to edges to facilitate manufacturing.
- Add Cooling Channels using predefined templates or custom paths.
- Incorporate Ejector Pins with precise locations and sizes.
- Validate the design by running Interference Checks and Draft Analysis.

Advanced Tips and Best Practices

- Use Standard Libraries: CATIA offers libraries for standard mold components, which streamline the process.
- Maintain Proper Draft Angles: Usually between 1° to 3°, to allow easy ejection.
- Design for Manufacturability: Keep in mind machining constraints and material properties.
- Simulate Material Flow: Use CATIA's Mold Flow module for analyzing how the molten material fills the mold, revealing potential issues early.
- Document Your Design: Use annotations and detailed drawings for manufacturing and quality control.

Verifying and Preparing the Final Mold Design

After completing the core and cavity:

- Conduct Tolerances Analysis: Ensure all parts fit within the specified tolerances.

- Generate Manufacturing Drawings: Detail views, section cuts, and annotations.
- Create Tool Paths: Export data for CNC machining, including 3D tool paths for milling or EDM.
- Prototype and Test: If possible, produce a prototype to verify the mold's functionality.
