Limiting reagent question and answer key

Limiting Reagent Question and Answer Key

Understanding limiting reagents is fundamental for mastering stoichiometry in chemistry. The limiting reagent (or limiting reactant) determines the maximum amount of product that can be formed in a chemical reaction. This concept is crucial when analyzing reaction yields, optimizing reactions, and solving various chemistry problems. In this comprehensive guide, we will explore common limiting reagent questions, step-by-step solutions, and an answer key to help students grasp this essential concept confidently.

What Is a Limiting Reagent?

Definition

A limiting reagent is the reactant in a chemical reaction that is completely consumed first, thereby limiting the amount of product formed. Once it is used up, the reaction cannot proceed further, regardless of the quantities of other reactants remaining.

Significance in Chemistry

- Determines the maximum theoretical yield of products.
- Helps in calculating how much product can be formed.
- Aids in optimizing chemical processes and reducing waste.

Basic Concepts for Limiting Reagent Problems

Key Steps in Solving Limiting Reagent Questions

- Write the balanced chemical equation: Ensure you understand the mole ratio between reactants and products.
- Convert given quantities to moles: Use molar masses to switch from grams to moles.
- Calculate the amount of product each reactant can produce: Use mole ratios to determine theoretical yields.
- Identify the limiting reagent: The reactant that produces the least amount of product.
- Calculate the actual yield and remaining reactants (if needed).

Common Mistakes to Avoid

- Forgetting to balance the chemical equation.
- Confusing mass with moles.
- Using incorrect mole ratios.

- Assuming the limiting reagent is the one in smaller mass without conversion to moles.

Typical Limiting Reagent Question and Solution Examples

Example 1: Basic Limiting Reagent Calculation

Question:

Given 10.0 g of hydrogen gas (H₂) and 80.0 g of oxygen gas (O₂), which is the limiting reagent in the formation of water (H₂O)? How much water can be produced?

Solution:

Step 1: Write the balanced equation:

Step 2: Convert grams to moles:

- Moles of H₂:

$$\frac{10.0\text{ g}}{2.016\text{ g/mol}} \approx 4.96\text{ mol}$$

- Moles of O₂:

$$\frac{80.0\text{ g}}{32.00\text{ g/mol}} = 2.50\text{ mol}$$

Step 3: Determine the mole ratio:

- From the balanced equation, 2 mol H₂ reacts with 1 mol O₂.

Step 4: Calculate the amount of water produced from each reactant:

- From H₂:

$$4.96\text{ mol H}_2 \times \frac{2\text{ mol H}_2\text{O}}{2\text{ mol H}_2} = 4.96\text{ mol H}_2\text{O}$$

- From O₂:

$$\left[2.50 \text{ mol O}_2 \times \frac{2 \text{ mol H}_2\text{O}}{1 \text{ mol O}_2} = 5.00 \text{ mol H}_2\text{O} \right]$$

Step 5: Identify the limiting reagent:

- H₂ produces 4.96 mol H₂O
- O₂ can produce 5.00 mol H₂O

Since H₂ produces less water, H₂ is the limiting reagent.

Step 6: Calculate the mass of water produced:

$$\left[4.96 \text{ mol} \times 18.015 \text{ g/mol} \approx 89.5 \text{ g} \right]$$

Answer:

Hydrogen gas is the limiting reagent, and approximately 89.5 grams of water can be formed.

Example 2: Limiting Reagent with Excess Reactant

Question:

In the reaction of 5.0 g of aluminum (Al) with 10.0 g of iodine (I₂), which is limiting? How much aluminum iodide (AlI₃) can be produced?

Reaction:

Solution:

Step 1: Convert grams to moles:

- Al:

$$\left[\frac{5.0 \text{ g}}{26.98 \text{ g/mol}} \approx 0.185 \text{ mol} \right]$$

- I₂:

$$\left[\frac{10.0\text{g}}{253.81\text{g/mol}} \approx 0.0394\text{mol} \right]$$

Step 2: Use mole ratios:

- From the balanced equation, 2 mol Al reacts with 3 mol I₂.

- Calculate how much Al can react with available I₂:

$$\left[0.0394\text{mol I}_2 \times \frac{2\text{mol Al}}{3\text{mol I}_2} \approx 0.0263\text{mol Al} \right]$$

Step 3: Determine the limiting reagent:

- Available Al: 0.185 mol

- Needed for all I₂: 0.0263 mol

Since only 0.0263 mol Al will react (limited by I₂), I₂ is the limiting reagent.

Step 4: Calculate mass of AlI₃ produced:

- From the stoichiometry, 2 mol Al produce 2 mol AlI₃:

$$\left[0.0263\text{mol Al} \times \frac{2\text{mol AlI}_3}{2\text{mol Al}} = 0.0263\text{mol AlI}_3 \right]$$

- Molar mass of AlI₃:

$$\left[26.98 + 3 \times 126.90 = 402.68\text{g/mol} \right]$$

- Mass of AlI₃:

$$\left[0.0263\text{mol} \times 402.68\text{g/mol} \approx 10.58\text{g} \right]$$

Answer:

Iodine is the limiting reagent, and approximately 10.58 grams of aluminum iodide can be produced.

Practice Questions and Solutions

Question 1:

When 50 g of nitrogen gas (N₂) reacts with 25 g of hydrogen gas (H₂) to produce ammonia (NH₃), which reactant is limiting? How much ammonia can be formed?

Solution:

Step 1: Write balanced equation:

Step 2: Convert to moles:

- N₂:

$$\frac{50\text{ g}}{28.013\text{ g/mol}} \approx 1.79\text{ mol}$$

- H₂:

$$\frac{25\text{ g}}{2.016\text{ g/mol}} \approx 12.40\text{ mol}$$

Step 3: Determine the max amount of NH₃ from each reactant:

- From N₂:

$$1.79\text{ mol N}_2 \times \frac{2\text{ mol NH}_3}{1\text{ mol N}_2} = 3.58\text{ mol NH}_3$$

- From H₂:

$$12.40\text{ mol H}_2 \times \frac{2\text{ mol NH}_3}{3\text{ mol H}_2} \approx 8.27\text{ mol NH}_3$$

Step 4: Limiting reagent:

- N₂ can produce less NH₃ (3.58 mol), so N₂ is limiting.

Step 5: Calculate mass of NH₃:

$$[3.58 \text{ mol} \times 17.03 \text{ g/mol} \approx 61.0 \text{ g}]$$

Answer:

Nitrogen gas is limiting, and about 61.0 grams of ammonia can be formed.

Additional Tips for Limiting Reagent Problems

- Always balance the chemical equation first to understand mole ratios.
- Convert all given masses to moles before calculations.
- Compare the mole ratios to determine which reactant produces the lesser amount of product.
- Remember that the limiting reagent is the one that produces the least amount of product based on available moles.
- Use the mole ratio to find the theoretical yield of the desired product.
- In questions involving excess reactants, only the limiting reagent's calculations determine the maximum product formed.

Summary

Understanding the limiting reagent question and answer key is essential for solving stoichiometry problems accurately. The key steps involve balancing the chemical equation, converting known quantities to moles, applying mole ratios, and comparing the potential product amounts from each reactant. Recognizing the limiting reagent allows chemists to predict maximum yields, optimize reactions, and minimize waste. Practice with various problems enhances problem-solving skills and deepens understanding of this fundamental concept in chemistry.

What Is the Limiting Reagent?

Defining the Concept

In any chemical reaction, reactants are combined in specific molar ratios dictated by the balanced chemical equation. The limiting reagent (or limiting reactant) is the substance that runs out first, thus stopping the reaction from proceeding further. Once this reactant is exhausted, no additional products can form, regardless of the amount of the other reactants remaining.

Significance in Stoichiometry

Identifying the limiting reagent is crucial for:

- Calculating theoretical yields
- Determining reaction efficiency
- Planning resource utilization in industrial processes

Understanding which reactant limits the reaction ensures precise predictions and efficient use of materials.

How to Identify the Limiting Reagent: Step-by-Step Approach

Step 1: Write and Balance the Chemical Equation

Ensure the chemical equation is balanced. This establishes the molar ratios of reactants and products.

Step 2: Convert Given Quantities to Moles

Use molar masses to convert all given quantities (mass, volume, or particles) of reactants into moles.

Step 3: Calculate the Theoretical Moles of Products

Using the mole ratios from the balanced equation, determine how much product each reactant can produce if it were the limiting reagent.

Step 4: Determine the Limiting Reagent

Compare the theoretical product amounts calculated for each reactant. The reactant producing the smaller amount of product is the limiting reagent.

Step 5: Calculate the Excess Reactant Remaining (if needed)

Subtract the amount of reactant that reacted from the initial amount to find remaining quantities of excess reactants.

Typical Limiting Reagent Questions: Examples and Solutions

Let's explore some common question types and their detailed solutions to help you grasp the concept thoroughly.

Example 1: Simple Mass-to-Mass Problem

Question:

Given 10 grams of hydrogen gas (H_2) and 80 grams of oxygen gas (O_2), which is the limiting reagent in the formation of water (H_2O)?

Solution:

- Write the balanced equation:

- Convert masses to moles:

- Molar mass of H_2 = 2 g/mol

- Molar mass of O_2 = 32 g/mol

For H_2 : $10 \text{ g} \div 2 \text{ g/mol} = 5 \text{ mol}$

For O?: $80 \text{ g} \div 32 \text{ g/mol} = 2.5 \text{ mol}$

- Determine the mole ratios needed:

According to the balanced equation,

- 2 mol H? reacts with 1 mol O?
- So, for 5 mol H?, the required O? = $(1 \text{ mol O?} / 2 \text{ mol H?}) \times 5 \text{ mol H?} = 2.5 \text{ mol O?}$

- Compare available and required amounts:

- Available O? = 2.5 mol (matches requirement)
- H? needed for 2.5 mol O? = $(2 \text{ mol H?} / 1 \text{ mol O?}) \times 2.5 \text{ mol O?} = 5 \text{ mol H?}$

Since we have exactly 5 mol H?, both reactants are perfectly matched; thus, neither is limiting under these ideal conditions. The reaction proceeds until one reactant is exhausted.

Answer:

Both H? and O? are present in stoichiometric amounts; the reaction is perfectly balanced, with no limiting reagent in this scenario.

Example 2: Excess Reactant and Limiting Reagent

Question:

In a reaction where 50 grams of aluminum (Al) reacts with 100 grams of hydrochloric acid (HCl), which is the limiting reagent?

Solution:

- Balanced equation:

- Convert to moles:

- Molar mass of Al = 26.98 g/mol
- Molar mass of HCl = 36.46 g/mol

Aluminum: $50 \text{ g} \div 26.98 \text{ g/mol} = 1.85 \text{ mol}$

HCl: $100 \text{ g} \div 36.46 \text{ g/mol} = 2.74 \text{ mol}$

- Determine the required molar ratio:

From the equation,

- 2 mol Al reacts with 6 mol HCl
- For 1.85 mol Al, required HCl = $(6 \text{ mol HCl} / 2 \text{ mol Al}) \times 1.85 \text{ mol Al} = 5.55 \text{ mol}$

- Compare with available HCl:

- Available HCl = 2.74 mol, which is less than the required 5.55 mol

Conclusion:

HCl is the limiting reagent because it is insufficient to react with all the aluminum. Aluminum is in excess.

Answer:

Hydrochloric acid (HCl) is the limiting reagent.

Common Pitfalls and Tips in Limiting Reagent Problems

Pitfall 1: Forgetting to Balance the Chemical Equation

An unbalanced equation skews molar ratios, leading to incorrect conclusions. Always verify the equation first.

Pitfall 2: Mixing Units

Ensure all quantities are converted to moles before comparison. Mixing grams, liters, and particles can cause errors.

Pitfall 3: Neglecting Excess Reactants

Remember, the limiting reagent is the one that runs out first; excess reactants remain unreacted.

Tip: Use a Table for Clarity

Construct a table listing initial amounts, mole ratios, and the amount reacted to keep track of calculations systematically.

Practical Applications of Limiting Reagent Analysis

Industrial Chemistry

Optimizing reactant quantities to maximize product yield while minimizing waste relies heavily on limiting reagent calculations.

With mastery of the limiting reagent question and answer key, you'll navigate chemical reactions with confidence and precision.

Question What is the limiting reagent in a chemical reaction? The limiting reagent is the reactant that is completely consumed first, limiting the amount of product formed in a chemical reaction. How do you determine the limiting reagent in a reaction? You compare the molar amounts of each reactant based on the balanced chemical equation and identify which reactant will run out first when reacting in the given molar ratios. Why is identifying the limiting reagent important? It helps in calculating the maximum amount of product that can be formed and ensures efficient use of reactants without excess waste. What is the typical step-by-step process to solve a limiting reagent problem? First, write the balanced chemical equation, then convert all reactant quantities to moles, compare the mole ratios with the balanced equation, identify the limiting reagent, and finally calculate the theoretical yield based on it. Can there be more than one limiting reagent in a reaction? No, typically only one reagent is limiting; however, there can be scenarios with multiple limiting reagents if the reaction conditions are complex, but generally, only one limits the reaction. How do you find the theoretical yield once the limiting reagent is identified? Use the moles of the limiting reagent to calculate the maximum amount of product obtainable, based on the molar ratio from the balanced chemical equation. What common mistakes should be avoided when solving limiting reagent problems? Avoid forgetting to balance the chemical equation, neglecting to convert quantities to moles, and mixing up molar ratios; always double-check calculations and units.
