End of Review

Question What is the difference between a wave and a sound? A wave is a disturbance that travels through a medium, transferring energy, while sound is a type of wave that specifically travels through air or other mediums as a vibration we can hear. How does the frequency of a wave affect the pitch of sound? Higher frequency waves produce higher-pitched sounds, while lower frequency waves produce lower-pitched sounds. What is the role of amplitude in sound waves? Amplitude determines the loudness of the sound; larger amplitudes produce louder sounds, while smaller amplitudes produce softer sounds. How do echoes occur in relation to sound waves?

Echoes occur when sound waves reflect off surfaces and return to the listener, allowing us to hear the sound again after a delay. What is the speed of sound and what factors affect it? The speed of sound is the rate at which sound waves travel through a medium. It is affected by the medium's density, temperature, and elasticity; for example, sound travels faster in solids than in gases. Why do different materials produce different sounds when struck? Different materials vibrate at different frequencies and amplitudes, producing distinct sounds based on their properties such as density, elasticity, and shape. What is resonance and how does it relate to sound waves? Resonance occurs when an object vibrates at its natural frequency due to an external sound wave of the same frequency, often amplifying the sound. How can we demonstrate the properties of waves using a skill sheet? A skill sheet can include activities like drawing wave diagrams, measuring frequency and amplitude, and conducting experiments with tuning forks or string instruments to understand wave properties. What are the applications of waves and sound in everyday life? Waves and sound are used in technologies like musical instruments, medical imaging (ultrasound), communication (radio and phone signals), and safety devices like sirens and alarm systems.

Sample "Float My Boat" Math Problems and Solutions

Problem 1: Will the Boat Float?

Question: A boat weighs 200 kg and is made of wood with a density of 0.6 g/cm³. The boat's volume is 500,000 cm³. Will the boat float in water?

Solution:

- First, find the weight of water displaced by the boat when floating.
- The density of water = 1 g/cm³.
- The weight of the boat in grams:

$$200 \text{ kg} = 200,000 \text{ g}.$$

- The weight of water displaced (buoyant force) when floating must be equal to the weight of the boat.
- Volume of water displaced = volume of the boat = 500,000 cm³.
- Weight of displaced water = 500,000 cm³ × 1 g/cm³ = 500,000 g = 500 kg.
- Since the boat weighs only 200 kg, and it displaces water weighing 500 kg, it will float.

Answer: Yes, the boat will float because its weight is less than the weight of water it displaces.

Problem 2: Calculating the Volume of an Irregular Object

Question: A metal object weighs 3 kg and sinks when placed in water. Its density is 7.8 g/cm³. What is the volume of the object?

Solution:

- Convert the weight to grams: 3 kg = 3000 g.
- Use the formula:

$$\text{Volume} = \text{mass} / \text{density}$$

- Volume = $3000 \text{ g} / 7.8 \text{ g/cm}^3 \approx 384.62 \text{ cm}^3$

Answer: The volume of the object is approximately 385 cm³.

Problem 3: Determining the Total Weight of a Boat and Cargo

Question: A boat with a volume of 1,200,000 cm³ is made of wood with a density of 0.6 g/cm³. The boat is carrying cargo weighing 500 kg. Will it float?

Solution:

- Find the weight of the boat:
- Volume of boat = 1,200,000 cm³
- Density of wood = 0.6 g/cm³
- Mass of the boat = $1,200,000 \times 0.6 \text{ g} = 720,000 \text{ g} = 720 \text{ kg}$
- Total weight (boat + cargo) = $720 \text{ kg} + 500 \text{ kg} = 1,220 \text{ kg}$
- Displaced water weight when floating:
- Volume of displaced water = volume of the boat = 1,200,000 cm³
- Weight of displaced water = $1,200,000 \text{ g} = 1,200 \text{ kg}$
- Since total weight (1,220 kg) exceeds the displaced water weight (1,200 kg), the boat will sink.

Answer: No, the boat will sink because the total weight exceeds the buoyant capacity.

Deep Dive into Sample "Float My Boat" Problems and Solutions

Sample Problem 1: Calculating Displacement and Buoyancy

Scenario: A boat with a volume of $10,000 \text{ cm}^3$ is made of a material with a density of 2.5 g/cm^3 . Will the boat float in water? Assume the boat is fully submerged.

Solution Approach:

- Calculate the mass of the boat:

$$\text{Mass} = \text{Volume} \times \text{Density} = 10,000 \text{ cm}^3 \times 2.5 \text{ g/cm}^3 = 25,000 \text{ g.}$$

- Determine the weight of the displaced water:

Since the boat is fully submerged, it displaces $10,000 \text{ cm}^3$ of water.

- Density of water = 1 g/cm^3 .
- Displaced water weight = $10,000 \text{ g}$.
- Compare boat mass and displaced water weight:
- Boat weight = $25,000 \text{ g}$.
- Displaced water weight = $10,000 \text{ g}$.

Conclusion: The boat's weight exceeds the buoyant force (displaced water weight), so it would sink.

Answer Validation: The provided answer in the worksheet's answer key should confirm that the boat sinks under these conditions.

Sample Problem 2: Designing a Floatable Boat

Scenario: You are to design a boat that can carry a load of 5000 g. The boat's hull has a volume of 8,000 cm³, and it is made of a material with a density of 1.8 g/cm³. Can the boat carry the load without sinking?

Solution Approach:

- Calculate the weight of the boat:
- Boat material mass = $8,000 \text{ cm}^3 \times 1.8 \text{ g/cm}^3 = 14,400 \text{ g}$.
- Determine additional volume needed to support the load:
- Total weight to support = boat + load = $14,400 \text{ g} + 5,000 \text{ g} = 19,400 \text{ g}$.
- Calculate the total displaced water volume:
- Since water density is 1 g/cm³, the total displaced volume required = total weight in grams = 19,400 cm³.
- Assess if the boat can support this:
- Current hull volume = 8,000 cm³.
- Additional volume needed = $19,400 \text{ cm}^3 - 8,000 \text{ cm}^3 = 11,400 \text{ cm}^3$.

Conclusion: The boat must have a total volume of at least 19,400 cm³ to carry the load safely; otherwise, it will sink.

Answer Validation: The answer key should specify whether the existing hull volume suffices or if modifications are necessary.

Role of Answer Keys in Promoting Effective Learning

Answer keys are more than just solutions; they serve as tools for self-assessment, reinforcing correct methodologies, and identifying misconceptions. When answer keys are accurate and accompanied by explanations, they enhance learning by:

- Clarifying complex concepts such as buoyancy and displacement.
